

Custom Colors and Formats

No Inkjet, No Halftones, No Toner,
Just Paint

We pride ourselves on the ability to design, select, and build custom color targets from commercially available colors by X-Rite and the Natural Color System (NCS) colors. With our indexed colorimetric database to these colors we can help you select the best color match to your specifications without breaking the budget. If necessary we can even provide custom formulated paints of selected color and gloss levels. We can also choose from other unique and specialized materials from Acktar, LabSphere, and Golden Paints. Each set of custom targets come with colorimetric and spectral data for each patch.

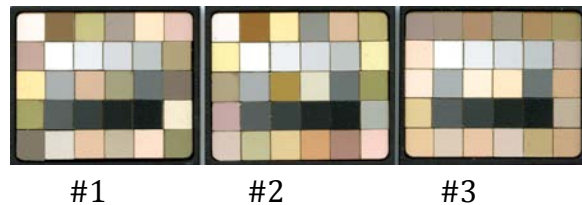

The smallest individual patch size we can reliably make and hand assemble is approx. 1/16". At sizes this small, some cosmetic deviations in patch alignment are likely, We have found that this rarely affects the utility of the target. We can provide proofs of custom targets before final delivery.

Below are some examples of custom targets we have delivered to customers:

Custom dental imaging colors,
Customer A
Pico Size

Custom dental imaging colors,
Customer B
Nano Size

24 patch grayscale
Customer C
Pico and Nano targets,

Custom Pico format with SFR feature
Customer D
